Memo

On this memo you will find the detailed instructions on how to perform a proper and safe body burial while working for Bobby Singer's Yard. Working with possessed bodies and the supernatural employees must follow safety procedures for their safety and the safety of everyone around them. Failing to follow safety procedures could result in possession or even death. Please read over the instructions carefully and make sure you understand how to follow the procedures.

1. Before performing a body burial all employees must take a shower on the anti-demon coating. This shower will prevent you from become posses in case there is a daemon still in the dead body.
 - a. Make sure the anti-daemon coating is evenly applied to every part of your body, daemons can take possession of your body by coming in contact with any exposed body part that has no hair.
 - b. After you shower, Dry off with the deamonizer towel. This towel is what will activate the coating. If you fail to perform this step the coating will not be effective.

2. Put on your body burial suit immediately after drying. The suit is designed to protect the coat. Walking around naked could expose you to elements that may reduces the effectiveness and power of the anti daemon.
 - a. Start off with the helmet. The face is the most important part to protect as it is often the first part a daemon will try to attack.
 - b. After placing helmet on head. Put on chest protection by strapping it around your body.
 - c. Secure the latches of the helmet and chest.
 - d. Walk into the lower body machine facing towards the wall. This automated machine will put the pants on for you.
 - e. Put on the boots and make sure they are secured to your feet.

3. Once you have the body suit on you must walk into the air compression room. This will create an air tight seal to that there you do no come in contact with potential harm.
 - a. Walk into the room and connect the hose to the valve on the right side of your pants.
 - b. When the green light turns on, press the red button. This will initiate the air tight seal.
 - c. CAUTION: due to the nature of this procedure you might suffer from claustrophobia.

4. To perform a burial use the DIGdator10 to open a whole in the ground big enough for the body
 - a. Make sure you do not re open a grave, look for orange warning signs that indicated a body has been buried here before.
 - b. Use a crane or help from another employee to put the body into the ground.
 - c. WARNING: do not attempt to move a body by yourself.
5. Once the body is in the ground apply the burial ingredients.
 - a. Check that your suite indicator light is green, do not perform this step without your suit being functional.
 - b. First apply the 3-pound salt bag to give the body a coat.
 - c. Then apply the lemon juice to fill the grave up until half the body is covered.

d.

6. Use the torch to ignite the body on fire.

- a. Be very careful with this step. You must be 10 feet away from grave to avoid burn and potential contamination.
- b. Once the fire starts dying down start to cover the grave.

7. Once the grave is completely covered make sure to place the orange warning.

- a. **IMPORTANT:** this step is required in order to prevent anyone else from reopening this grave without proper element.

8. After burial is complete, please dispose of all the equipment used in its proper bin in the changing room.

- a. **Attention:** It is recommended to shower immediately after the job is complete in order to reduce any remaining risk of contamination.
